

PATCH Requests

PATCH endpoints (such as [Update service](#)) enable you to update details of an existing resource. The following conventions apply to PATCH endpoints in the Render API:

No nested resources

PATCH endpoints are not used for updating nested resources. For example, if you want to manage custom domains for a service, you wouldn't do this through the Update service endpoint, but would instead use the [Add custom domain](#) and [Delete custom domain](#) endpoints.

What gets updated?

PATCH endpoints update any resource fields that you provide a new value for in your request body. This is true *even if a provided value is null/empty*. In this case, the endpoint removes or unsets the field for the resource.

Any resource fields you *omit entirely* from your request body remain unchanged.
